

ServiceInsight

ASSET MANAGEMENT

Maintain greater control of your assets. Keep your facilities running efficiently.

ServiceInsight is the workplace command center that optimizes the employee experience and asset performance. Our clients benefit from a solution that delivers excellence with efficiency and the right tool for every role in the work order process.

Assets must be properly maintained in order to keep facilities running at peak efficiency. Tracking equipment and managing the work performed on your assets can be easily accomplished via ServiceInsight's Asset, PM, and Inventory modules, decreasing system downtime and increasing utilization and productivity.

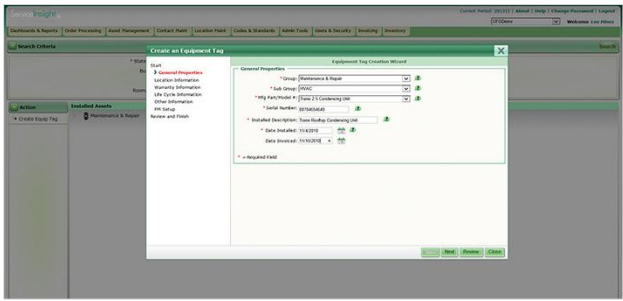

Simple and complete asset management.

HIGHLY SCALABLE AND FLEXIBLE DATABASE

Track assets of all types, including sites, serialized equipment, non-serialized parts, inventory, and components. Convenient tree view allows an easier way to determine relationships between equipment. ServiceInsight's three-level equipment structure supports Equipment Group, Subgroup, and Serialized or Non-Serialized Part correlation.

MAINTAIN ACCURATE RECORDS

Record and track data about equipment and locations including order history, specifications, date invoiced, expected lifetime, warranty information, associated PM jobs, barcode ID, criticality, associated components, and other details that will assist managers and technicians. Attach manufacturers' specifications, drawings, or photos to assets, PM jobs, work orders, and more. Data is stored on the database, providing one reference location for all users.

Capture relevant data such as serial number, warranty details, life cycle information, and more when creating new equipment tags in the easy-to-use tag creation wizard.

TRANSFER AND RETIRE ASSETS

Easily transfer assets between locations, place on hold, return from inventory, or retire. History associated with the asset will be preserved.

STREAMLINED PROCESS TO RECEIVE AND RECORD NEW ASSETS

Creation Wizards allow users to quickly and easily enter new equipment records into the system, capturing relevant data to be stored in the record. Tag assets as they are installed and optionally assign barcodes. Designate assets to specific PM jobs. Indicate as Critical and calculate Life Cycle projections for improved reporting.

ASSET-BASED WORK ORDERS

Generate work orders based on a specific asset. Whether added to the work order during Call Entry, through the work order cycle, or onsite by a Service Technician via mobile application, the system will link the work order to the asset.

FLEXIBLE SEARCH OPTIONS

Multiple search parameters such as location, part number, or description support easy lookup within the database.

HISTORICAL DATA COLLECTION

Complete Work Order history can be viewed and analyzed for each asset, providing managers with the information they need when it comes time to evaluate replacement.

ANALYZE AND REPORT

Utilize ServiceInsight's extensive reporting module to generate reports on asset conditions, life cycle reports, PM forecasts, and work orders associated with assets.

INTEGRATED WARRANTY TRACKING

Track your warranty information. Color-coded traffic lights provide visual cues as to the warranty status of a given asset in various screens throughout the product. Users will understand at a glance whether the asset is covered under warranty, outside of warranty period but considered serviceable, or maintenance and repair should not be performed.

Easily create serialized tags and view the installed assets at a given location. Traffic lights indicate warranty status of each asset.

Optimize Your Workplace

As part of the ServiceInsight workplace command center, Asset Management automates the preventative maintenance process, helping clients drive excellence through efficiency.
